Related titles from Woodhead’s food science, technology and nutrition list:

*Bender’s dictionary of nutrition and food technology Seventh edition* (ISBN: 1 85573 475 3)

‘This valuable book continues to fulfil the purpose of explaining to specialists in other fields the technical terms in nutrition and food processing.’ *Chemistry and Industry*

The classic work of reference for all those working in the food industry, studying or researching at university or college.

*Physical properties of foods and food processing systems* (ISBN: 1 85573 272 6)

‘… an excellent choice as textbook.’ *Food Technology*

A standard text for students and professionals on the key physical properties of foods during processing.

*Principles and practices for the safe processing of foods* (ISBN: 1 85573 362 5)

‘… it is such a comprehensive text on safe processing – a must have.’ *Food Engineering*

The standard guide on safe process design and operation, both for students and the food industry.

‘Overall this is one of the best books available on the subject of meat science, and is ideal for all students of food science and technology.’ *Chemistry in Britain*

Introduction
  The food industry today
  About this book
  Note on the second edition

PART I BASIC PRINCIPLES

1 Properties of foods and processing theory
  1.1 Properties of liquids, solids and gases
      1.1.1 Density and specific gravity
      1.1.2 Viscosity
      1.1.3 Surface activity
      1.1.4 Rheology and texture
  1.2 Material transfer
  1.3 Fluid flow
      1.3.1 Fluid flow through fluidised beds
  1.4 Heat transfer
      1.4.1 Energy balances
      1.4.2 Mechanisms of heat transfer
      1.4.3 Sources of heat and methods of application to foods
      1.4.4 Energy conservation
      1.4.5 Effect of heat on micro-organisms
      1.4.6 Effect of heat on nutritional and sensory characteristics
  1.5 Water activity
      1.5.1 Effect of $a_w$ on foods
  1.6 Effects of processing on sensory characteristics of foods

© 2000 Woodhead Publishing Limited and CRC Press LLC
1.6.1 Texture
1.6.2 Taste, flavour and aroma
1.6.3 Colour
1.7 Effects of processing on nutritional properties
1.8 Food safety, good manufacturing practice and quality assurance
1.8.1 HACCP
1.8.2 Hurdle technology
1.9 Acknowledgements
1.10 References

2 Process control
2.1 Automatic control
  2.1.1 Sensors
  2.1.2 Controllers
2.2 Computer-based systems
  2.2.1 Programmable logic controllers (PLCs)
  2.2.2 Types of control systems
  2.2.3 Software developments
  2.2.4 Neural networks
2.3 Acknowledgements
2.4 References

PART II AMBIENT-TEMPERATURE PROCESSING

3 Raw material preparation
3.1 Cleaning
  3.1.1 Wet cleaning
  3.1.2 Dry cleaning
  3.1.3 Removing contaminants and foreign bodies
3.2 Sorting
  3.2.1 Shape and size sorting
  3.2.2 Colour sorting
  3.2.3 Weight sorting
3.3 Grading
3.4 Peeling
  3.4.1 Flash steam peeling
  3.4.2 Knife peeling
  3.4.3 Abrasion peeling
  3.4.4 Caustic peeling
  3.4.5 Flame peeling
3.5 Acknowledgements
3.6 References

4 Size reduction
4.1 Size reduction of solid foods
  4.1.1 Theory
  4.1.2 Equipment
  4.1.3 Effect on foods

© 2000 Woodhead Publishing Limited and CRC Press LLC
4.2 Size reduction in liquid foods (emulsification and homogenisation)
   4.2.1 Theory
   4.2.2 Equipment
   4.2.3 Effect on foods

4.3 Acknowledgements

4.4 References

5 Mixing and forming
   5.1 Mixing
      5.1.1 Theory of solids mixing
      5.1.2 Theory of liquids mixing
      5.1.3 Equipment
      5.1.4 Effect on foods
   5.2 Forming
      5.2.1 Bread moulders
      5.2.2 Pie and biscuit formers
      5.2.3 Confectionery moulders

5.3 Acknowledgements

5.4 References

6 Separation and concentration of food components
   6.1 Centrifugation
      6.1.1 Theory
      6.1.2 Equipment
   6.2 Filtration
      6.2.1 Theory
      6.2.2 Equipment
   6.3 Expression
      6.3.1 Theory
      6.3.2 Equipment
   6.4 Extraction using solvents
      6.4.1 Theory
      6.4.2 Equipment
   6.5 Membrane concentration (hyperfiltration and ultrafiltration)
      6.5.1 Theory
      6.5.2 Equipment
   6.6 Effect on foods
   6.7 Acknowledgements

6.8 References

7 Fermentation and enzyme technology
   7.1 Fermentation
      7.1.1 Theory
      7.1.2 Types of food fermentations
      7.1.3 Equipment
      7.1.4 Effect on foods
   7.2 Enzyme technology
      7.2.1 Enzyme production from micro-organisms
      7.2.2 Application of enzymes in food processing

8 Irradiation

8.1 Theory
8.2 Equipment
  8.2.1 Measurement of radiation dose
  8.2.2 Dose distribution
8.3 Effect on micro-organisms
8.4 Applications
  8.4.1 Sterilisation (or ‘radappertisation’)
  8.4.2 Reduction of pathogens (or ‘radicidation’)
  8.4.3 Prolonging shelf life (or ‘radurisation’)
  8.4.4 Control of ripening
  8.4.5 Disinfestation
  8.4.6 Inhibition of sprouting
8.5 Effect on foods
  8.5.1 Induced radioactivity
  8.5.2 Radiolytic products
  8.5.3 Nutritional and sensory value
8.6 Effect on packaging
8.7 Detection of irradiated foods
  8.7.1 Physical methods
  8.7.2 Chemical methods
  8.7.3 Biological methods
8.8 Acknowledgement
8.9 References

9 Processing using electric fields, high hydrostatic pressure, light or ultrasound

9.1 Pulsed electric field processing
  9.1.1 Theory
  9.1.2 Equipment
9.2 High pressure processing
  9.2.1 Theory
  9.2.2 Processing and equipment
  9.2.3 Effect on micro-organisms, enzymes and food components
9.3 Processing using pulsed light
  9.3.1 Theory
  9.3.2 Equipment and operation
  9.3.3 Effect on micro-organisms and foods
9.4 Processing using ultrasound
  9.4.1 Theory
  9.4.2 Application to processing
9.5 Other methods
9.6 References
PART III   PROCESSING BY APPLICATION OF HEAT

A. Heat processing using steam or water

10  Blanching
  10.1  Theory
  10.2  Equipment
    10.2.1  Steam blanchers
    10.2.2  Hot-water blanchers
  10.3  Effect on foods
    10.3.1  Nutrients
    10.3.2  Colour and flavour
    10.3.3  Texture
  10.4  Acknowledgement
  10.5  References

11  Pasteurisation
  11.1  Theory
  11.2  Equipment
    11.2.1  Pasteurisation of packaged foods
    11.2.2  Pasteurisation of unpackaged liquids
  11.3  Effect on foods
    11.3.1  Colour, flavour and aroma
    11.3.2  Vitamin loss
  11.4  Acknowledgements
  11.5  References

12  Heat sterilisation
  12.1  In-container sterilisation
    12.1.1  Theory
    12.1.2  Retorting (heat processing)
    12.1.3  Equipment
  12.2  Ultra high-temperature (UHT)/aseptic processes
    12.2.1  Theory
    12.2.2  Processing
    12.2.3  Equipment
  12.3  Effect on foods
    12.3.1  Colour
    12.3.2  Flavour and aroma
    12.3.3  Texture or viscosity
    12.3.4  Nutritive value
  12.4  Acknowledgements
  12.5  References

13  Evaporation and distillation
  13.1  Evaporation
    13.1.1  Theory
    13.1.2  Equipment
  13.2  Effect on foods
13.3 Distillation
13.4 Acknowledgements
13.5 References

14 Extrusion
14.1 Theory
   14.1.1 Rheological properties of the food
   14.1.2 Operating characteristics
14.2 Equipment
   14.2.1 Single-screw extruders
   14.2.2 Twin-screw extruders
   14.2.3 Ancillary equipment
14.3 Applications
   14.3.1 Cold extrusion
   14.3.2 Extrusion cooking
14.4 Effect on foods
   14.4.1 Sensory characteristics
   14.4.2 Nutritional value
14.5 Acknowledgements
14.6 References

B. Heat processing using hot air

15 Dehydration
15.1 Theory
   15.1.1 Drying using heated air
   15.1.2 Drying using heated surfaces
15.2 Equipment
   15.2.1 Hot-air driers
   15.2.2 Heated-surface (or contact) driers
15.3 Effect on foods
   15.3.1 Texture
   15.3.2 Flavour and aroma
   15.3.3 Colour
   15.3.4 Nutritional value
15.4 Rehydration
15.5 Acknowledgements
15.6 References

16 Baking and roasting
16.1 Theory
16.2 Equipment
   16.2.1 Direct heating ovens
   16.2.2 Indirect heating ovens
   16.2.3 Batch ovens
   16.2.4 Continuous and semi-continuous ovens
16.3 Effect on foods
   16.3.1 Texture
   16.3.2 Flavour, aroma and colour

© 2000 Woodhead Publishing Limited and CRC Press LLC
16.3.3 Nutritional value
16.4 Acknowledgements
16.5 References

C. Heat processing using hot oils

17 Frying
17.1 Theory
   17.1.1 Shallow (or contact) frying
   17.1.2 Deep-fat frying
17.2 Equipment
17.3 Effect on foods
   17.3.1 Effect of heat on oil
   17.3.2 Effect of heat on fried foods
17.4 Acknowledgements
17.5 References

D. Heat processing by direct and radiated energy

18 Dielectric, ohmic and infrared heating
18.1 Dielectric heating
   18.1.1 Theory
   18.1.2 Equipment
   18.1.3 Applications
   18.1.4 Effect on foods
18.2 Ohmic heating
   18.2.1 Theory
   18.2.2 Equipment and applications
18.3 Infrared heating
   18.3.1 Theory
   18.3.2 Equipment
   18.3.3 Effect on foods
18.4 Acknowledgements
18.5 References

PART IV PROCESSING BY THE REMOVAL OF HEAT

19 Chilling
19.1 Theory
   19.1.1 Fresh foods
   19.1.2 Processed foods
   19.1.3 Cook–chill systems
19.2 Equipment
   19.2.1 Mechanical refrigerators
   19.2.2 Cryogenic chilling
19.3 Chill storage
   19.3.1 Control of storage conditions

© 2000 Woodhead Publishing Limited and CRC Press LLC
20 Controlled- or modified-atmosphere storage and packaging
20.1 Modified- and controlled-atmosphere storage (MAS and CAS)
20.2 Modified-atmosphere packaging
   20.2.1 MAP for fresh foods
   20.2.2 MAP for processed foods
   20.2.3 Packaging materials for MAP
   20.2.4 Active packaging systems
20.3 Acknowledgement
20.4 References

21 Freezing
21.1 Theory
   21.1.1 Ice crystal formation
   21.1.2 Solute concentration
   21.1.3 Volume changes
   21.1.4 Calculation of freezing time
21.2 Equipment
   21.2.1 Cooled-air freezers
   21.2.2 Cooled-liquid freezers
   21.2.3 Cooled-surface freezers
   21.2.4 Cryogenic freezers
21.3 Changes in foods
   21.3.1 Effect of freezing
   21.3.2 Effects of frozen storage
   21.3.3 Thawing
21.4 Acknowledgements
21.5 References

22 Freeze drying and freeze concentration
22.1 Freeze drying (lyophilisation)
   22.1.1 Theory
   22.1.2 Equipment
   22.1.3 Effect on foods
22.2 Freeze concentration
   22.2.1 Theory
   22.2.2 Equipment
22.3 Acknowledgements
22.4 References

PART V POST-PROCESSING OPERATIONS

23 Coating or enrobing
23.1 Coating materials
   23.1.1 Batters, powders and breadcrumbs
23.1.2 Chocolate and compound coatings
23.2 Enrobers
23.3 Dusting or breading
23.4 Pan coating
  23.4.1 Hard coatings
  23.4.2 Soft coatings
  23.4.3 Chocolate coating
23.5 Acknowledgements
23.6 References

24 Packaging
  24.1 Theory
    24.1.1 Light
    24.1.2 Heat
    24.1.3 Moisture and gases
    24.1.4 Micro-organisms, insects, animals and soils
    24.1.5 Mechanical strength
  24.2 Types of packaging materials
    24.2.1 Textiles and wood
    24.2.2 Metal
    24.2.3 Glass
    24.2.4 Flexible films
    24.2.5 Rigid and semi-rigid plastic containers
    24.2.6 Paper and board
    24.2.7 Combined packaging systems
    24.2.8 Active packaging technologies
  24.3 Printing
    24.3.1 Bar codes and other markings
  24.4 Interactions between packaging and foods
  24.5 Environmental considerations
    24.5.1 Packaging costs
    24.5.2 Manufacture of packaging materials
    24.5.3 Distribution of packaging materials and ingredients for food production
    24.5.4 Distribution to retailers and consumers
    24.5.5 Consumer recycling
  24.6 Acknowledgements
  24.7 References

25 Filling and sealing of containers
  25.1 Rigid and semi-rigid containers
    25.1.1 Filling
    25.1.2 Sealing
  25.2 Flexible containers
  25.3 Types of sealer
    25.3.1 Form–fill–seal (FFS) equipment
  25.4 Shrink-wrapping and stretch-wrapping
  25.5 Tamper-evident packaging
  25.6 Labelling

© 2000 Woodhead Publishing Limited and CRC Press LLC
26.1 Materials handling
   26.1.1 Handling equipment for raw materials and ingredients
   26.1.2 Handling equipment for processing

26.2 Waste management and disposal

26.3 Storage

26.4 Distribution

26.5 Acknowledgements

26.7 References

Appendices
A Vitamins in foods
B Nutritional and functional roles of minerals in foods
C EU permitted food additives
D Units and dimensions
I am indebted to the large number of people who have given freely of their time and experience, provided me with information, checked the text and gave support during this revision of *Food Processing Technology*. My particular thanks to Dr Mike Lewis of Reading University for his support and technical editing skills; to Dr Mike Dillon of MD Associates for his assistance with Section 1.8 (Quality Assurance); to Francis Dodds of Woodhead Publishing for ideas, suggestions and references to new information; to staff and colleagues at Oxford Brookes University, particularly Professor Jeya Henry and Dr Neil Heppell for their advice and ideas; and to Dr Jeremy Selman at Campden Food RA. for his information. My thanks also to the many companies that responded positively to my requests for information about their equipment, machinery and products. They are listed individually at the end of each chapter. I should also not forget my parents, Jack and Gwen, who have always given unquestioning support to my efforts, and finally, but not least, my special thanks to my partner, Wen, for her constructive thoughts, encouragement and forbearance at my long hours in front of the computer screen over the best part of a year.
Glossary

Absorption  Uptake of moisture by dry foods.
Acid food  A food with a pH of less than 4.6 and a water activity ($a_w$) equal to or greater than 0.85.
Additives  Chemicals added to food to improve their eating quality or shelf life.
Adiabatic  Changes to the humidity and temperature of air without loss or gain of heat (in drying).
Adiabatic process  Processing in which no heat is added or removed from a system.
Adulterants  Chemicals that are intentionally added to food which are forbidden by law.
Agglomeration  The production of granules from powder particles.
Algorithms  Software building blocks used to construct control sequences in computerised process control.
Alkaline phosphatase  An enzyme in raw milk having a similar $D$-value to heat-resistant pathogens, used to test for effectiveness of pasteurisation.
Annealing  Heating to control the ductility of a material.
Aseptic processing  Heat sterilisation of foods before filling into pre-sterilised (aseptic) containers.
Atomiser  A device to form fine droplets of food (e.g. in a spray drier).
Bacteriocins  Naturally produced peptides that inhibit other micro-organisms, similar in effect to antibiotics.
Baroresistance  Resistance to high pressure.
Barosensitivity  Sensitivity to high pressure.
Biological oxidation demand (BOD)  A measure of the oxygen requirement by micro-organisms when breaking down organic matter, used as a measure of the polluting potential of materials in water.
Black body  A theoretical concept for a material that can either absorb all the heat that lands on it or radiate all of the heat that it contains.
Blancher  Equipment used to blanch foods.
Blanching  Heating foods, especially vegetables, to below 100°C for a short time, to both inactivate enzymes which would cause a loss of quality during storage and to remove air and soften the food.
Blinding  Blocking of a sieve by food particles.

<tbody>
<tr>
<td>Bloom</td>
<td>A thin layer of unstable forms of cocoa fat that crystallise at the surface</td>
</tr>
<tr>
<td>of a coating to produce dullness or white specks.</td>
<td></td>
</tr>
<tr>
<td>Botulin</td>
<td>An exotoxin produced by Cl. Botulinum, able to cause fatal food poisoning.</td>
</tr>
<tr>
<td>Bound moisture</td>
<td>Liquid physically or chemically bound to a solid food matrix which</td>
</tr>
<tr>
<td></td>
<td>exerts a lower vapour pressure than pure liquid at the same temperature.</td>
</tr>
<tr>
<td>Boundary film (or surface film)</td>
<td>Film of fluid next to the surface over which a fluid flows that causes a resistance to heat transfer.</td>
</tr>
<tr>
<td>Breading</td>
<td>The application of pre-prepared breadcrumbs to the surface of a food.</td>
</tr>
<tr>
<td>Calandria</td>
<td>Heat exchanger used in an evaporator.</td>
</tr>
<tr>
<td>Carborundum</td>
<td>An abrasive material made from silicon and carbon.</td>
</tr>
<tr>
<td>Case hardening</td>
<td>Formation of a hard impermeable skin on some foods during drying,</td>
</tr>
<tr>
<td></td>
<td>which reduces the rate of drying and produces a food with a dry surface</td>
</tr>
<tr>
<td></td>
<td>and a moist interior.</td>
</tr>
<tr>
<td>Cashflow</td>
<td>The balance of money at a given time entering and leaving a business.</td>
</tr>
<tr>
<td>Cavitation</td>
<td>Production of bubbles in foods by ultrasound and their rapid expansion/contraction.</td>
</tr>
<tr>
<td>Centrifugation</td>
<td>The separation of immiscible liquids or solids from liquids by the</td>
</tr>
<tr>

<td>are used to replace cocoa butter.</td>
</tr>
<tr>
<td>Conduction</td>
<td>The movement of heat by direct transfer of molecular energy within solids.</td>
</tr>
<tr>
<td>Constant-rate drying</td>
<td>The drying period in which the rate of moisture loss is constant when</td>
</tr>
<tr>
<td></td>
<td>surface moisture is removed.</td>
</tr>
<tr>
<td>Continuous phase</td>
<td>The medium that contains the dispersed phase in an emulsion.</td>
</tr>
</tbody>
</table>
Convection  The transfer of heat in fluids by groups of molecules that move as a result of differences in density or as a result of agitation.

Critical control point (CCP)  A processing factor of which a loss of control would result in an unacceptable food safety or quality risk.

Critical moisture content  The amount of moisture in a food at the end of the constant-rate period of drying.

Crumb  Pre-prepared breadcrumbs used to cover food pieces, or the porous inner part of baked foods.

Crust  Hard surface layer on baked foods.

Cryogen  A refrigerant that absorbs latent heat and changes phase from solid or liquid to a gas, e.g., subliming or evaporating carbon dioxide or liquid nitrogen.

Cryogenic freezers  Equipment that uses subliming or evaporating carbon dioxide or liquid nitrogen directly in contact with food to freeze it.

Cryogenic grinding  Mixing liquid nitrogen or solid carbon dioxide with food to cool it during grinding.

Dead-folding  A crease or fold made in a material that will stay in place.

Decimal reduction time  The time needed to destroy 90% of micro-organisms (to reduce their numbers by a factor of 10).

Depositor  Machine for placing an accurate amount of food onto a conveyor or into a mould.

Desorption  Removal of moisture from a food.

Detergents  Chemicals that reduce the surface tension of water and hence assist in the release of soils from equipment or foods.

Dew point  Temperature at which an air–water vapour mixture becomes saturated with moisture, marking the onset of condensation.

Diafiltration  A process to improve the recovery of solutes by diluting the concentrate during reverse osmosis or ultrafiltration.

Die  A restricted opening at the discharge end of an extruder barrel.

Dielectric constant  The ratio of the capacitance of a food to the capacitance of air or vacuum under the same conditions.

Dielectric heating  A generic term that includes heating by both microwave and radio frequency energy.

Dilatant material  Food in which the consistency increases with shear rate.

Direct heating ovens  Ovens in which products of combustion are in contact with the food.

Dispersed phase  Droplets in an emulsion.

Dosimeter  A device that qualitatively or quantitatively measures the dose of irradiation received by a food.

Dry bulb temperature  Temperature measured by a dry thermometer in an air–water vapour mixture.

Effective freezing time  The time required to lower the temperature of a food from an initial value to a pre-determined final temperature at the thermal centre.

Electrical conductivity  The capacity of a material to conduct electricity.

Electrodialysis  The separation of electrolytes into anions and cations by the application of a direct electrical current and the use of ion-selective membranes.

Emulsification  Creation of an emulsion by the dispersion of one immiscible liquid (dispersed phase) in the form of small droplets in a second immiscible liquid (continuous phase).

Emulsifying agent  Chemical that forms micelles around each droplet in the dispersed phase of an emulsion to reduce interfacial tension and prevent droplets from coalescing.

Enrobing  The unit operation in which food pieces are coated with chocolate or other materials.

<tr>
<td>Hermetically-sealed container</td>
<td>A package that is designed to be secure against entry of micro-organisms and maintain the commercial sterility of its contents after processing.</td>
</tr>
<tr>
<td>Heterofermentative micro-organisms</td>
<td>Micro-organisms that produce more than one main metabolic product.</td>
</tr>
<tr>
<td>Homofermentative micro-organisms</td>
<td>Micro-organisms that produce a single main byproduct.</td>
</tr>
<tr>
<td>Homogenisation</td>
<td>The reduction in size and increase in number of solid or liquid particles in the dispersed phase.</td>
</tr>
<tr>
<td>Humectants</td>
<td>Chemicals (e.g. salt, sugar, glycerol) that are able to lower the water activity in a food by depressing the vapour pressure.</td>
</tr>
<tr>
<td>Hydrocooling</td>
<td>Immersion of fruits and vegetables in chilled water.</td>
</tr>
<tr>
<td>Hydrophilic-lipophilic balance (HLB value)</td>
<td>The ratio of hydrophilic to hydrophobic groups on the molecules of an emulsifier.</td>
</tr>
<tr>
<td>Hygroscopic foods</td>
<td>Foods in which the partial pressure of water vapour varies with the moisture content.</td>
</tr>
<tr>
<td>Hydrostatic head</td>
<td>The pressure resulting from the weight of a column of liquid.</td>
</tr>
<tr>
<td>Hyperfiltration</td>
<td>Reverse osmosis.</td>
</tr>
<tr>
<td>Impact strength</td>
<td>The force required to penetrate a material.</td>
</tr>
<tr>
<td>Indirect heating ovens</td>
<td>Ovens in which heat from combustion is passed through a heat exchanger to heat air which is then in contact with the food.</td>
</tr>
<tr>
<td>Inventory</td>
<td>The stored accumulation of materials in an operation.</td>
</tr>
<tr>
<td>Ion exchange</td>
<td>The selective removal of charged molecules from a liquid by electrostatic adsorption, followed by their transfer to a second liquid using an ion-exchange material.</td>
</tr>
<tr>
<td>Ionisation</td>
<td>Breakage of chemical bonds (e.g. during irradiation).</td>
</tr>
<tr>
<td>Irradiation</td>
<td>The use of γ-rays to preserve foods by destruction of micro-organisms or inhibition of biochemical changes.</td>
</tr>
<tr>
<td>Isostatic</td>
<td>Uniform pressure throughout a food.</td>
</tr>
<tr>
<td>Isotope</td>
<td>A source of γ-rays from a radioactive material such as cobalt-60 or caesium-137.</td>
</tr>
<tr>
<td>Just-in-time</td>
<td>Management system in which goods are ordered as they are required and stocks are not held in warehouses.</td>
</tr>
<tr>
<td>Kinetic energy</td>
<td>Energy due to motion.</td>
</tr>
<tr>
<td>Lamination</td>
<td>Bonding together of two or more packaging films, papers or foods.</td>
</tr>
<tr>
<td>Latent heat</td>
<td>Heat taken up or released when a material undergoes a change of state.</td>
</tr>
<tr>
<td>Leaching</td>
<td>Washing out of soluble components from the food.</td>
</tr>
<tr>
<td>Lethality</td>
<td>Integrated effect of heating temperature and time on micro-organisms.</td>
</tr>
<tr>
<td>Loss factor</td>
<td>A measure of the amount of energy that a material will dissipate when subjected to an alternating electric field (in microwave and dielectric heating). (Also termed the ‘dielectric loss’ or ‘loss tangent’.)</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Low acid food</td>
<td>A food with a pH greater than 4.6 and a water activity ($a_w$) equal to or greater than 0.85.</td>
</tr>
<tr>
<td>Manufacturing resource</td>
<td>Computer-based systems used to control distribution networks by using forecasted demand for and actual orders to assist management decisions.</td>
</tr>
<tr>
<td>planning</td>
<td></td>
</tr>
<tr>
<td>Material requirement planning</td>
<td>A single integrated computer system, containing a database that can be accessed by all parts of the company for management planning.</td>
</tr>
<tr>
<td>Mechanical refrigerators</td>
<td>Equipment which evaporates and compresses a refrigerant in a continuous cycle, using cooled air, cooled liquid or cooled surfaces to freeze foods.</td>
</tr>
<tr>
<td>Metallisation</td>
<td>A thin coating of aluminium on plastic packaging.</td>
</tr>
<tr>
<td>Microfiltration</td>
<td>A pressure-driven membrane process using membranes with a pore size of 0.2–2 $\mu$m at lower pressures than ultrafiltration.</td>
</tr>
<tr>
<td>Microwaves</td>
<td>Energy produced commercially at frequencies of 2450 MHz for domestic ovens, 896 MHz for industrial heating in Europe and 915 MHz for industrial heating in the USA.</td>
</tr>
<tr>
<td>Mimetics</td>
<td>Low calorie fat substitutes.</td>
</tr>
<tr>
<td>Mimic panel</td>
<td>A graphical display of a process.</td>
</tr>
<tr>
<td>Moulders</td>
<td>Machines that form dough or confectionery into different shapes.</td>
</tr>
<tr>
<td>Multiple effect</td>
<td>The re-use of vapour from boiling liquor in one evaporator as the heating medium in another evaporator operating at a lower pressure.</td>
</tr>
<tr>
<td>Nanofiltration</td>
<td>A membrane process to separate particles with molecular weights from 300–1000 Da, using lower pressures than reverse osmosis.</td>
</tr>
<tr>
<td>Neural networks</td>
<td>Computer systems that are able to analyse complex relationships in a process and ‘learn’ from experience.</td>
</tr>
<tr>
<td>Nip</td>
<td>The gap between rollers in a mill or a moulding/forming machine.</td>
</tr>
<tr>
<td>Nominal freezing time</td>
<td>The time between the surface of the food reaching 0ºC and the thermal centre reaching 10ºC below the temperature of the first ice formation.</td>
</tr>
<tr>
<td>Non-hygroscopic foods</td>
<td>Foods that have a constant water vapour pressure at different moisture contents.</td>
</tr>
<tr>
<td>Non-Newtonian liquid</td>
<td>Food in which the viscosity changes with rate of shear.</td>
</tr>
<tr>
<td>Nuclation</td>
<td>The formation of a nucleus of water molecules that is required for ice crystal formation.</td>
</tr>
<tr>
<td>Ohmic heating</td>
<td>Direct electrical heating of foods.</td>
</tr>
<tr>
<td>Overall heat transfer coefficient (OHTC)</td>
<td>The sum of the resistances to heat flow due to conduction and convection.</td>
</tr>
<tr>
<td>Panning</td>
<td>The process of building up thin layers of sugar, sweetener or other coatings in a controlled way onto solid cores of nuts, fruit, etc.</td>
</tr>
<tr>
<td>Pasteurisation</td>
<td>A relatively mild heat treatment in which food is heated to below 100ºC to preserve it without substantial changes to sensory characteristics or nutritional value. In low acid foods, the main reason for pasteurisation is destruction of pathogens.</td>
</tr>
<tr>
<td>Pinholes</td>
<td>Small holes in can seams or flexible packaging.</td>
</tr>
<tr>
<td>Plasticiser</td>
<td>Chemicals added to plastic films to make them more flexible.</td>
</tr>
<tr>
<td>Polymorphic fat</td>
<td>A fat that can crystallise into more than one form.</td>
</tr>
<tr>
<td>Potential energy</td>
<td>Energy due to position of an object.</td>
</tr>
<tr>
<td>Preforms</td>
<td>Small dense pellets made in an extruder from pre-gelatinised cereal dough, which are suitable for extended storage until they are converted to snackfoods by frying, toasting or puffing. (Also known as ‘half-products’.)</td>
</tr>
<tr>
<td>Press cake</td>
<td>Solid residue remaining after extraction of liquid component from foods.</td>
</tr>
<tr>
<td>Process inter-locking</td>
<td>Linking different parts of a process so that one cannot operate until a...</td>
</tr>

Programmable logic controllers (PLCs) A microcomputer that is used in process control to replace electrical relays and to collect and store process data.

Pseudoplastic material Food in which the viscosity decreases with increasing shear rate.

Psychrometrics The study of inter-related properties of air–water vapour systems.

Radiation The transfer of heat by electromagnetic waves.

Radio frequency energy Energy produced commercially at frequencies of 13.56 MHz, 27.12 MHz or 40.68 MHz for industrial heating.

Radiolysis Changes to a food material caused by ionising radiation to produce chemicals that destroy micro-organisms, etc.

Recrystallisation Physical changes to ice crystals (changes in shape, size or orientation) which are an important cause of quality loss in some frozen foods.

Redox potential Oxidation/reduction potential of a food or microbial substrate.

Refrigerant A liquid that has a low boiling point and high latent heat of vaporisation so that it can change phase and absorb or lose heat in a refrigerator.

Refrigerators Equipment that evaporates and compresses a refrigerant in a continuous cycle, using cooled air, cooled liquid or cooled surfaces to freeze foods.

Relative humidity The ratio of the partial pressure of water vapour in air to the pressure of saturated water vapour at the same temperature, multiplied by 100.

Respiration Metabolic activity of living animal or plant tissues.

Retort A pressurised vessel used to heat foods above 100°C during canning.

Reverse osmosis Unit operation in which small molecular weight solutes (with molecular weights of approx. 100 DA) are selectively removed by a semi-permeable membrane under high pressure.

Screen A sieve.

Sensible heat Heat used to raise the temperature of a food or removed during cooling, without a change in phase.

Sequence control A type of process control in which the completion of one operation signals the start of the next.

Soils A generic term used for all types of contaminating materials on foods or equipment.

Sorption isotherm A curve produced from different values of relative humidity plotted against equilibrium moisture content.

Sorting The separation of foods into categories on the basis of a measurable physical property.

Specific electrical resistance Electrical resistance of a food between two 1 cm² electrodes that are located 1 cm apart (i.e. the resistance of 1 cm³ of product), having units of ohms cm⁻² cm⁻¹.

Specific growth rate The slope of the curve when the natural logarithm of microbial cell concentration is plotted against time.

Specific heat The amount of heat that accompanies a unit change in temperature by a unit mass of material.

Stabilisers Hydrocolloids that dissolve in water to form viscous solutions or gels.

Steady-state heat transfer Heating or cooling when there is no change in temperature at any specific location.

Sterilants Chemicals that inactivate micro-organisms.

Streamline (or laminar) flow Flow of liquids in layers without significant mixing between layers.

Sublimation A change in state of water directly from ice to water vapour without melting.

Substrate A growth medium for micro-organisms.

<tbody>
<tr>
<td>Supercooling</td>
<td>A phenomenon in which water remains liquid although the temperature is below its freezing point.</td>
</tr>
<tr>
<td>Supercritical carbon dioxide</td>
<td>Liquid CO₂ used to extract food components.</td>
</tr>
<tr>
<td>Supervisory Control and Data Acquisition (SCADA)</td>
<td>A type of computer software that collects data from programmable logic controllers and displays it as graphics to operators in real-time.</td>
</tr>
<tr>
<td>Surface heat transfer coefficient</td>
<td>A measure of the resistance to heat flow caused by a boundary film of liquid.</td>
</tr>
<tr>
<td>Susceptor</td>
<td>A packaging material that is used to create a localised high temperature in microwave ovens; usually made from lightly metallised polyethylene terephthalate.</td>
</tr>
<tr>
<td>Tempering</td>
<td>Cooling food to close to its freezing point, or a process of re-heating, stirring and cooling chocolate to remove unstable forms of polymorphic fats.</td>
</tr>
<tr>
<td>Tensile elongation</td>
<td>A measure of the ability to stretch.</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>The force needed to stretch a material.</td>
</tr>
<tr>
<td>Thermal centre</td>
<td>The point in a food that heats or cools most slowly.</td>
</tr>
<tr>
<td>Thermal conductivity</td>
<td>A measure of the heat transfer properties of solid materials.</td>
</tr>
<tr>
<td>Thermal death time (TDT) or F-value</td>
<td>The time required to achieve a specified reduction in microbial numbers at a given temperature.</td>
</tr>
<tr>
<td>Thermal diffusivity</td>
<td>The ratio of thermal conductivity of a product to specific heat, multiplied by the density.</td>
</tr>
<tr>
<td>Thermal shock</td>
<td>Heating: fracture to a glass container caused by rapid changes in temperature; freezing: a rapid reduction in temperature that causes foods to fracture.</td>
</tr>
<tr>
<td>Ultra high temperature (UHT)</td>
<td>Processing heat sterilisation at above 135°C for a few seconds.</td>
</tr>
<tr>
<td>Ultrafiltration</td>
<td>Unit operation in which solutes having molecular weights in the range of 1–200 kDA are selectively removed using a semi-permeable membrane operating at lower pressure than reverse osmosis.</td>
</tr>
<tr>
<td>Ultrasonication</td>
<td>Treatment of foods using ultrasound.</td>
</tr>
<tr>
<td>Unitised loads</td>
<td>Grouping of packages into larger loads.</td>
</tr>
<tr>
<td>Usage value</td>
<td>The rate of usage of individual materials in an inventory multiplied by their individual value.</td>
</tr>
<tr>
<td>Unsteady-state heat transfer</td>
<td>Heating or cooling where the temperature of the food and/or the heating or cooling medium are constantly changing.</td>
</tr>
<tr>
<td>Venting</td>
<td>Removal of air from a retort before heat processing.</td>
</tr>
<tr>
<td>Viscoelastic material</td>
<td>Food materials which exhibit viscous and elastic properties including stress relaxation, creep and recoil.</td>
</tr>
<tr>
<td>Voidage</td>
<td>The fraction of the total volume occupied by air (the degree of openness) of a bed of material in fluidised-bed drying.</td>
</tr>
<tr>
<td>Water activity</td>
<td>The ratio of vapour pressure of water in a solid to that of pure water at the same temperature.</td>
</tr>
<tr>
<td>Web</td>
<td>A packaging film.</td>
</tr>
<tr>
<td>Wet bulb temperature</td>
<td>Temperature measured by a wet thermometer in an air–water vapour mixture.</td>
</tr>
<tr>
<td>Yield</td>
<td>Weight of food after processing compared to weight before processing.</td>
</tr>
<tr>
<td>Young’s modulus</td>
<td>(also modulus of elasticity) = stress/strain and is a measure of the hardness of a material.</td>
</tr>

The food industry today

The aims of the food industry today, as in the past, are fourfold:

1. To extend the period during which a food remains wholesome (the shelf life) by preservation techniques which inhibit microbiological or biochemical changes and thus allow time for distribution, sales and home storage.
2. To increase variety in the diet by providing a range of attractive flavours, colours, aromas and textures in food (collectively known as eating quality, sensory characteristics or organoleptic quality); a related aim is to change the form of the food to allow further processing (for example the milling of grains to flour).
3. To provide the nutrients required for health (termed nutritional quality of a food).
4. To generate income for the manufacturing company.

Each of these aims exists to a greater or lesser extent in all food production, but the processing of a given product may emphasise some more than others. For example, frozen vegetables are intended to have sensory and nutritional qualities that are as close as possible to the fresh product, but with a shelf life of several months instead of a few days or weeks. The main purpose of freezing is therefore to preserve the food. In contrast, sugar confectionery and snackfoods are intended to provide variety in the diet, and a large number of shapes, flavours, colours and textures are produced from basic raw materials.

All food processing involves a combination of procedures to achieve the intended changes to the raw materials. These are conveniently categorised as unit operations, each of which has a specific, identifiable and predictable effect on a food. Unit operations are grouped together to form a process. The combination and sequence of operations determines the nature of the final product.

In industrialised countries the market for processed foods is changing, and in contrast to earlier years, consumers no longer require a shelf life of several months at ambient temperature for the majority of their foods. Changes in family lifestyle, and increased ownership of freezers and microwave ovens, are reflected in demands for foods that are convenient to prepare, are suitable for frozen or chilled storage, or have a moderate shelf
life at ambient temperatures. There is now an increasing demand by consumers for foods that have fewer synthetic additives, or have undergone fewer changes during processing. These foods more closely resemble the original raw materials and have a ‘healthy’ or ‘natural’ image. Correspondingly, growth in demand for organic foods has significantly increased in Europe during the 1990s. These pressures are an important influence on changes that are taking place in the food processing industry, and manufacturers have responded by reducing or eliminating synthetic additives from products (particularly colourants and flavours) and substituting them with natural or ‘nature-equivalent’ alternatives. They have also introduced new ranges of low-fat, sugar-free or low-salt products in nearly all sub-sectors (Anon., 1999). New products that are supplemented with vitamins, minerals and probiotic cultures (or ‘functional’ foods) have appeared in recent years, and products containing organic ingredients are now widely available. At the time of writing (2000), a debate over the safety of genetically modified (GM) food ingredients is unresolved. Consumer pressure for more ‘natural’ products has also stimulated development of novel ‘minimal’ processes that reduce the changes to sensory characteristics or nutritional value of foods.

Improvements to food quality during the last 10–15 years have also been achieved through changes in legislation, including legal requirements on manufacturers and retailers to display ‘due diligence’ in protecting consumers from potentially hazardous foods. This has in part arisen from a series of highly publicised cases of food poisoning and food adulteration in Europe during the 1980s and 1990s, and the outbreak of Bovine Spongiform Encephalitis (BSE) in British cattle, which led to public pressure for improved food safety and quality. Legislation is now increasingly international in its focus and application, and international standards for both specific products and also for methods of achieving quality assurance are in force.

Trends that started during the 1960s and 1970s, and accelerated during the last 10–15 years, have caused food processors to change their operations in four key respects. First, there is increasing investment in capital intensive, automated processes to reduce labour and energy costs. Second, there has been a change in philosophy from quality control, achieved by testing final products, to a more sophisticated approach to quality assurance, which involves all aspects of management. Third, high levels of competition and slowing of the growth in the food market in Europe and USA during the 1970s, has caused manufacturers to adopt a more proactive approach to creating demand, using sophisticated marketing techniques and large advertising budgets. Mergers or take-overs of competitors have resulted from the increased competition. Fourth, there has been a shift in power and control of food markets from manufacturers to large retail companies.

The changes in technology have been influenced by a variety of factors: substantial increases in the costs of both energy and labour, by public pressure and legislation to reduce negative environmental effects of processing, particularly air or water pollution and energy consumption. Food processing equipment now has increasingly sophisticated levels of control to reduce processing costs, enable rapid change-overs between shorter production runs, to improve product quality and to provide improved records for management decisions. Microprocessors are now almost universally used to control food processing equipment. The automation of entire processes, from reception of materials, through processing and packaging to warehousing, has become a reality. This requires a higher capital investment by manufacturers but, together with improved quality assurance, reduces production costs and wastage. It increases production efficiency, uses less energy and often fewer operators, and generates increased revenue and market share from products that have higher quality.
The food industry has now become a global industry, dominated by a relatively few multinational conglomerates. Many of the mergers and take-overs that created these companies took place in the 1980s and early 1990s when large companies bought their competitors in order to acquire brand names and increase their market share. In 1988 for example, a total of $42.5 billion was spent on the purchase of just three companies (Rowntree, Kraft and Nabisco) (Giles, 1993). Multinational companies are now focusing on development of new markets and are either buying up or forming alliances with local competitors in South East Asia, India, Eastern Europe and Latin America.

Global sourcing of raw materials and ingredients has been a feature of some industries from their inception (spices, coffee, cocoa are a few examples), but this has now expanded to many more sectors, to reduce costs and ensure continuity of supply. These developments have in turn prompted increased consumer awareness of both ethical purchasing issues, such as employment and working conditions in suppliers’ factories, and also environmental issues, such as safeguards in countries which have less developed legislative controls, and the environmental impact of international transportation of foods by air. There has also been a resurgence of consumer interest in locally distinctive foods and ‘Fair-Traded’ foods in some European countries, but at the time of writing this is confined to higher value niche products.

During the last decade or so, there has been a substantial increase in the power and influence of large retailing companies, especially in the USA and Europe. Much of the change in food quality and choice that has been witnessed during this time has arisen from competition between these retail companies and the pressures that they have exerted on manufacturers. Manufacturers are now responding to the shift in power to supermarkets by forming international strategic alliances with other large manufacturers. This enables them to develop pan-regional economies of scale and to focus on their own core products while sharing the benefits of joint marketing or research and development. They are also promoting ‘tele-shopping’, especially using the Internet, and developing other types of sales outlets (e.g. at sports or cultural venues) that by-pass existing retailers.

**About this book**

Heat has important influences on food processing in a number of respects: it is the most convenient way of extending the shelf life of foods by destroying enzymic and microbiological activity, or by removing water to inhibit deterioration; it changes the nutritional and sensory qualities of foods; and generation of heat is a major processing cost. The unit operations described in this book are therefore grouped according to the nature of heat transfer that takes place.

After Part I, which describes some important basic concepts, Part II describes unit operations that take place at ambient temperature and involve minimum heating of foods; Part III includes those operations that heat foods to extend the shelf life or to alter the eating quality; Part IV describes operations that remove heat from foods to extend the shelf life with minimal changes in nutritional qualities and sensory characteristics; the final part, Part V, is concerned with operations that are integral to a food process but are supplementary to the main method of processing.

In each chapter, the theoretical basis of the unit operation is first described. Formulae required for calculation of processing parameters and sample problems are
given where appropriate, and sources of more detailed information are indicated. Details of the equipment used for practical implementation of theoretical concepts are then described, and developments in technology that relate to savings in energy or labour, or to improvement in product quality are noted. Finally the effect of the unit operation on sensory characteristics and nutritional properties of selected foods is described.

This book therefore aims to show how a knowledge of the properties of foods is used to design processing equipment and to control processing conditions on an industrial scale, to achieve the desired aims of altering the eating quality or extending the shelf life, with minimal changes to sensory characteristics and nutritional qualities. The book aims to introduce students of food science and technology, or biotechnology to the wide range of processing techniques that are used in food processing. It attempts to describe each topic at a level that is accessible without an advanced mathematical background, while providing reference to more detailed or more advanced texts. The book is therefore also suitable for students studying nutrition, catering or agriculture as an additional perspective on their subject areas.

Note on the second edition

There have been major developments in technology during the last decade which have justified new chapters on:

- computer control of processing (Chapter 2)
- novel food processes that have a minimal effect on food quality (Chapter 9 and ohmic heating in Chapter 18)
- modified atmosphere packaging (Chapter 20).

Nearly all of the unit operations described in the first edition have undergone significant developments and these are reflected in additional material in each chapter. This is especially so for:

- sorting foods (Chapter 3)
- membrane separation technologies (Chapter 6)
- bacteriocins (Chapter 7)
- detection of irradiated foods (Chapter 8)
- UHT/Aseptic processing (Chapter 12)
- chilling (Chapter 19)
- packaging (Chapters 24 and 25)
- materials handling (Chapter 26).

Additional material has also been included in Chapter 1 to both make the text more comprehensive and to include an outline of quality assurance and Hurdle Technology, and in Chapter 13 to include an outline of distillation.

Where appropriate, the original text has been clarified and edited, and new photographs, illustrations and tables have been included to provide additional information and updated descriptions of technologies. All new developments have been fully referenced in each chapter, and a new glossary of technical terms and list of acronyms has been included.
